## Education

**NIT Jalandhar**  
*Bachelor of Technology*

2022 – 2026  
CGPA: 8.48/10

## Skills

**Languages:** Python, JavaScript, C, C++ | **Frameworks/Libraries:** React, Express, NumPy, Pandas, Matplotlib, Scikit-Learn, Streamlit

**Databases:** MySQL, MongoDB | **Tools:** VS Code, GitHub, Anaconda Navigator, Canva, Paramiko, subprocess

**Coursework:** Data Structures and Algorithms, Object-Oriented Programming, DBMS, Operating Systems

## Experience

**Technical Intern, Cisco**

Feb 2026 – July 2026

*RAS Automation, Cisco UCS Intel M8 Servers / Python, C, C++, React, Flask, PostgreSQL, subprocess, Paramiko*

- Automating **RAS (Reliability, Availability, and Serviceability)** validation for Cisco **UCS Intel M8** servers by building fault-injection workflows to evaluate hardware resiliency, error handling, and recovery under high-load conditions.
- Developed target-aware automation for **PCIe, memory, CPU, and CXL/UPI** error-injection scenarios, automatically selecting applicable hardware targets and reducing manual validation effort by approximately **XX%**.
- Designed and developed a centralized dashboard using **React, Flask, and PostgreSQL**, enabling users to view previous jobs, select RAS features and error types, configure target-aware test runs, initiate execution, and monitor live logs.
- Implemented per-error-type artifact management to preserve live logs as **.log** files alongside result reports, OS error logs, register outputs, and register-validation reports, enabling convenient post-run access and failure analysis.
- Achieved approximately **90% validation accuracy** across automated fault-injection results by verifying system behavior, recovery mechanisms, OS error logs, and hardware register outputs increasing confidence in the reliability of next-generation UCS platforms.

## Projects

**Imagify – Full-Stack AI SaaS Web App**

[Link](#)

*React, Tailwind CSS, Node.js, Express, MongoDB, JWT, bcrypt, Clipdrop API, Axios*

- Built a full-stack AI SaaS application for text-to-image generation using the Clipdrop API, serving 100+ beta users with sub-second response time.
- Implemented secure JWT-based authentication, credit tracking, and activity management in MongoDB, reducing account-related issues by 60% and improving user flow reliability.
- Integrated a credits-based monetization flow with Razorpay, enabling free usage and paid recharges while supporting scalable backend workflows.
- Optimized client-server communication and API handling with Express and Axios, achieving 500ms average response time during testing.

**Movie Recommendation System**

[Link](#)

*Python, Streamlit, TF-IDF, Cosine Similarity, TMDB Dataset*

- Designed and deployed a **content-based movie recommendation system** that suggests the **top 5 similar movies** using features such as genre, cast, keywords, and plot overview to deliver personalized recommendations.
- Processed and analyzed **10,000+ TMDB records** by merging movie and credit datasets, cleaning metadata, and generating unified feature tags to strengthen recommendation quality and consistency.
- Applied **TF-IDF vectorization** and **cosine similarity** to capture semantic relationships between movies, improving recommendation accuracy by **30%** and enabling more relevant content matching.
- Built and launched an interactive **Streamlit** interface for **100+ beta users**, delivering recommendations in nearly **1 second** and improving overall user selection experience.

## Achievements

- Solved **500+ problems** across coding platforms with a contest rating of **1581+**.
- Finalist, CodeWithCisco Hackathon** – Engineered an **expense splitter** application in a 24-hour CodeWithCisco Hackathon, achieving finalist status among thousands of participants and securing a valuable six-month technical internship.
- Semi-Finalist, Flipkart Grid 4.0**, demonstrating strong problem-solving and product-building skills in a national-level competition.
- Finalist, Big-Brain Hackathon** among 150+ teams; built a PDF chatbot capable of processing 1,000+ pages with under 2 second query response time.
